## Chapter 3 — Full Expanded Questions 201–300

### **201. What is AWS CodePipeline and when do you use it?**

AWS CodePipeline is a fully managed CI/CD orchestration service used for building, testing, and deploying applications into AWS environments. It is ideal when teams want native AWS integrations without managing CI servers.

### **202. How do you securely authenticate CI/CD pipelines in AWS?**

Use OIDC federation to issue short-lived credentials so pipelines never store long-term access keys. IAM roles + trust relationships provide access control.

### **203. How do you design multi-region deployments using CI/CD?**

Use sequential or parallel deployment waves, Route53 weighted routing, and region-specific parameter stores. Use health checks before promoting to the next region.
